"Personality Classification System Using Data Mining," Sandhya Katiyar [5] One factor that influences how people connect with the outside environment is their personality. Personality is a crucial component of a person's actions. People's personalities are determined by how they connect with others. This article discusses Automated Personality Classification, which is a system that analyses a user's personality based on specific traits utilising Data Mining Algorithms. In this study, a technique for analysing an applicant's personality is suggested. This technique will be useful for organisations and other agencies who want to hire people based on their personality rather than their technical skills. The Big Five Personality characteristics are used to predict personality, and the categorization is done using the Nave Bayes Algorithm and Support Vector Machine.
